

On First-order Cons-free Term Rewriting and PTIME

Cynthia Kop

2 Apr, 2016

Overview

- ① Motivation
- ② First-order Term Rewriting
- ③ Characterising PTIME
- ④ Call-by-value Rewriting
- ⑤ Other Restrictions
- ⑥ Conclusions

Overview

- 1 Motivation
- 2 First-order Term Rewriting
- 3 Characterising PTIME
- 4 Call-by-value Rewriting
- 5 Other Restrictions
- 6 Conclusions

In 2001, Jones:

In 2001, Jones:

- defined a minimal functional programming language operating on lists

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- showed that arbitrary programs of data order k can be simulated by deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- showed that arbitrary programs of data order k can be simulated by deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- \implies proved that programs of data order k *characterise* EXPTIME^k

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- showed that arbitrary programs of data order k can be simulated by deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- \implies proved that programs of data order k *characterise* EXPTIME^k
- (proved several other characterisations as well)

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- showed that arbitrary programs of data order k can be simulated by deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- \implies proved that programs of data order k characterise EXPTIME^k
- (proved several other characterisations as well)

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- showed that arbitrary programs of data order k can be simulated by deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- \implies proved that programs of data order k characterise EXPTIME^k
- (proved several other characterisations as well)

Why not term rewriting?

Term rewriting:

Term rewriting:

- is the core calculus underlying functional programming

Term rewriting:

- is the core calculus underlying functional programming
- has a small definition (including higher-order versions)

Term rewriting:

- is the core calculus underlying functional programming
- has a small definition (including higher-order versions)
- already avoids complications present in real-world languages

Term rewriting:

- is the core calculus underlying functional programming
- has a small definition (including higher-order versions)
- already avoids complications present in real-world languages
- natively includes non-determinism

Term rewriting:

- is the core calculus underlying functional programming
- has a small definition (including higher-order versions)
- already avoids complications present in real-world languages
- natively includes non-determinism
- is supported by a large community with decades of theory

Term rewriting:

- is the core calculus underlying functional programming
- has a small definition (including higher-order versions)
- already avoids complications present in real-world languages
- natively includes non-determinism
- is supported by a large community with decades of theory
- allows for fine-tuning in many ways

Term rewriting:

- is the core calculus underlying functional programming
- has a small definition (including higher-order versions)
- already avoids complications present in real-world languages
- natively includes non-determinism
- is supported by a large community with decades of theory
- allows for fine-tuning in many ways

Let's see what comes out!

Overview

- 1 Motivation
- 2 First-order Term Rewriting**
- 3 Characterising PTIME
- 4 Call-by-value Rewriting
- 5 Other Restrictions
- 6 Conclusions

Terms: trees built from variables and function symbols.

Rules: generate a relation between terms.

Terms: trees built from variables and function symbols.

Rules: generate a relation between terms.

Example:

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbb{N} \\ S & : \quad [\mathbb{N}] \Rightarrow \mathbb{N} \end{array} \quad \begin{array}{ll} \text{Add} & : \quad [\mathbb{N} \times \mathbb{N}] \Rightarrow \mathbb{N} \\ \text{Mul} & : \quad [\mathbb{N} \times \mathbb{N}] \Rightarrow \mathbb{N} \end{array}$$

Terms: trees built from variables and function symbols.

Rules: generate a relation between terms.

Example:

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbb{N} \\ S & : \quad [N] \Rightarrow \mathbb{N} \end{array} \quad \begin{array}{ll} \text{Add} & : \quad [N \times N] \Rightarrow \mathbb{N} \\ \text{Mul} & : \quad [N \times N] \Rightarrow \mathbb{N} \end{array}$$

Rules:

$$\begin{array}{ll} \text{Add}(x, 0) & \rightarrow x \\ \text{Add}(0, y) & \rightarrow y \\ \text{Add}(x, S(y)) & \rightarrow S(\text{Add}(x, y)) \\ \text{Mul}(x, 0) & \rightarrow 0 \\ \text{Mul}(x, S(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x) \end{array}$$

Terms: trees built from variables and function symbols.

Rules: generate a relation between terms.

Example:

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbb{N} \\ S & : \quad [N] \Rightarrow \mathbb{N} \end{array} \quad \begin{array}{ll} \text{Add} & : \quad [N \times N] \Rightarrow \mathbb{N} \\ \text{Mul} & : \quad [N \times N] \Rightarrow \mathbb{N} \end{array}$$

Rules:

$$\begin{array}{ll} \text{Add}(x, 0) & \rightarrow x \\ \text{Add}(0, y) & \rightarrow y \\ \text{Add}(x, S(y)) & \rightarrow S(\text{Add}(x, y)) \\ \text{Mul}(x, 0) & \rightarrow 0 \\ \text{Mul}(x, S(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x) \end{array}$$

Example reduction:

$\text{Add}(S(0), S(0))$

Terms: trees built from variables and function symbols.

Rules: generate a relation between terms.

Example:

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbb{N} \\ S & : \quad [\mathbb{N}] \Rightarrow \mathbb{N} \end{array} \quad \begin{array}{ll} \text{Add} & : \quad [\mathbb{N} \times \mathbb{N}] \Rightarrow \mathbb{N} \\ \text{Mul} & : \quad [\mathbb{N} \times \mathbb{N}] \Rightarrow \mathbb{N} \end{array}$$

Rules:

$$\begin{array}{ll} \text{Add}(x, 0) & \rightarrow x \\ \text{Add}(0, y) & \rightarrow y \\ \text{Add}(x, S(y)) & \rightarrow S(\text{Add}(x, y)) \\ \text{Mul}(x, 0) & \rightarrow 0 \\ \text{Mul}(x, S(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x) \end{array}$$

Example reduction:

$\text{Add}(S(0), S(0))$

Terms: trees built from variables and function symbols.

Rules: generate a relation between terms.

Example:

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbb{N} \\ S & : \quad [N] \Rightarrow \mathbb{N} \end{array} \quad \begin{array}{ll} \text{Add} & : \quad [N \times N] \Rightarrow \mathbb{N} \\ \text{Mul} & : \quad [N \times N] \Rightarrow \mathbb{N} \end{array}$$

Rules:

$$\begin{array}{ll} \text{Add}(x, 0) & \rightarrow x \\ \text{Add}(0, y) & \rightarrow y \\ \text{Add}(x, S(y)) & \rightarrow S(\text{Add}(x, y)) \\ \text{Mul}(x, 0) & \rightarrow 0 \\ \text{Mul}(x, S(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x) \end{array}$$

Example reduction:

$$\text{Add}(S(0), S(0)) \rightarrow S(\text{Add}(S(0), 0))$$

Terms: trees built from variables and function symbols.

Rules: generate a relation between terms.

Example:

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbb{N} \\ S & : \quad [N] \Rightarrow \mathbb{N} \end{array} \quad \begin{array}{ll} \text{Add} & : \quad [N \times N] \Rightarrow \mathbb{N} \\ \text{Mul} & : \quad [N \times N] \Rightarrow \mathbb{N} \end{array}$$

Rules:

$$\begin{array}{ll} \text{Add}(x, 0) & \rightarrow x \\ \text{Add}(0, y) & \rightarrow y \\ \text{Add}(x, S(y)) & \rightarrow S(\text{Add}(x, y)) \\ \text{Mul}(x, 0) & \rightarrow 0 \\ \text{Mul}(x, S(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x) \end{array}$$

Example reduction:

$$\text{Add}(S(0), S(0)) \rightarrow S(\text{Add}(S(0), 0))$$

Terms: trees built from variables and function symbols.

Rules: generate a relation between terms.

Example:

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbb{N} \\ S & : \quad [N] \Rightarrow \mathbb{N} \end{array} \quad \begin{array}{ll} \text{Add} & : \quad [N \times N] \Rightarrow \mathbb{N} \\ \text{Mul} & : \quad [N \times N] \Rightarrow \mathbb{N} \end{array}$$

Rules:

$$\begin{array}{ll} \text{Add}(x, 0) & \rightarrow x \\ \text{Add}(0, y) & \rightarrow y \\ \text{Add}(x, S(y)) & \rightarrow S(\text{Add}(x, y)) \\ \text{Mul}(x, 0) & \rightarrow 0 \\ \text{Mul}(x, S(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x) \end{array}$$

Example reduction:

$$\text{Add}(S(0), S(0)) \rightarrow S(\text{Add}(S(0), 0))$$

Terms: trees built from variables and function symbols.

Rules: generate a relation between terms.

Example:

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbb{N} \\ S & : \quad [N] \Rightarrow \mathbb{N} \end{array} \quad \begin{array}{ll} \text{Add} & : \quad [N \times N] \Rightarrow \mathbb{N} \\ \text{Mul} & : \quad [N \times N] \Rightarrow \mathbb{N} \end{array}$$

Rules:

$$\begin{array}{ll} \text{Add}(x, 0) & \rightarrow x \\ \text{Add}(0, y) & \rightarrow y \\ \text{Add}(x, S(y)) & \rightarrow S(\text{Add}(x, y)) \\ \text{Mul}(x, 0) & \rightarrow 0 \\ \text{Mul}(x, S(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x) \end{array}$$

Example reduction:

$$\text{Add}(S(0), S(0)) \rightarrow S(\text{Add}(S(0), 0)) \rightarrow S(S(0))$$

Peculiarities

Note that:

Peculiarities

Note that:

- rule selection is non-deterministic (unless otherwise specified)

Peculiarities

Note that:

- rule selection is non-deterministic (unless otherwise specified)

 \end{aligned}$$

Overview

- 1 Motivation
- 2 First-order Term Rewriting
- 3 Characterising PTIME**
- 4 Call-by-value Rewriting
- 5 Other Restrictions
- 6 Conclusions

Extending cons-free

Extending cons-free

- in Jones: programs not containing the list constructor (“cons-free”)

Extending cons-free

- in Jones: programs not containing the list constructor (“cons-free”)
- in practice: no new data is created

Extending cons-free

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbf{N} & \text{Add} & : \quad [\mathbf{N} \times \mathbf{N}] \Rightarrow \mathbf{N} \\ \text{S} & : \quad [\mathbf{N}] \Rightarrow \mathbf{N} & \text{Mul} & : \quad [\mathbf{N} \times \mathbf{N}] \Rightarrow \mathbf{N} \end{array}$$

Rules:

$$\begin{array}{ll} \text{Add}(x, 0) & \rightarrow x \\ \text{Add}(0, y) & \rightarrow y \\ \text{Add}(x, \text{S}(y)) & \rightarrow \text{S}(\text{Add}(x, y)) \\ \text{Mul}(x, 0) & \rightarrow 0 \\ \text{Mul}(x, \text{S}(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x) \end{array}$$

Extending cons-free

Function symbols:

$$\begin{array}{ll} 0 & : \quad [] \Rightarrow \mathbf{N} \quad \text{Add} & : \quad [\mathbf{N} \times \mathbf{N}] \Rightarrow \mathbf{N} \\ \mathbf{S} & : \quad [\mathbf{N}] \Rightarrow \mathbf{N} \quad \text{Mul} & : \quad [\mathbf{N} \times \mathbf{N}] \Rightarrow \mathbf{N} \end{array}$$

Rules:

$$\begin{array}{ll} \text{Add}(x, 0) & \rightarrow x \\ \text{Add}(0, y) & \rightarrow y \\ \text{Add}(x, \mathbf{S}(y)) & \rightarrow \mathbf{S}(\text{Add}(x, y)) \\ \text{Mul}(x, 0) & \rightarrow 0 \\ \text{Mul}(x, \mathbf{S}(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x) \end{array}$$

Extending cons-free

Function symbols:

$$\begin{array}{ll}
 0 & : \quad [] \Rightarrow \mathbf{N} & \text{Add} & : \quad [\mathbf{N} \times \mathbf{N}] \Rightarrow \mathbf{N} \\
 S & : \quad [\mathbf{N}] \Rightarrow \mathbf{N} & \text{Mul} & : \quad [\mathbf{N} \times \mathbf{N}] \Rightarrow \mathbf{N}
 \end{array}$$

Rules:

$$\begin{array}{ll}
 \text{Add}(x, 0) & \rightarrow x \\
 \text{Add}(0, y) & \rightarrow y \\
 \text{Add}(x, S(y)) & \rightarrow S(\text{Add}(x, y)) \\
 \text{Mul}(x, 0) & \rightarrow 0 \\
 \text{Mul}(x, S(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x)
 \end{array}$$

Extending cons-free

Function symbols:

$$\begin{array}{ll}
 0 & : \quad [] \Rightarrow \mathbf{N} & \text{Add} & : \quad [\mathbf{N} \times \mathbf{N}] \Rightarrow \mathbf{N} \\
 S & : \quad [\mathbf{N}] \Rightarrow \mathbf{N} & \text{Mul} & : \quad [\mathbf{N} \times \mathbf{N}] \Rightarrow \mathbf{N}
 \end{array}$$

Rules:

$$\begin{array}{ll}
 \text{Add}(x, 0) & \rightarrow x \\
 \text{Add}(0, y) & \rightarrow y \\
 \text{Add}(x, S(y)) & \rightarrow \underline{S}(\text{Add}(x, y)) \\
 \text{Mul}(x, 0) & \rightarrow 0 \\
 \text{Mul}(x, S(y)) & \rightarrow \text{Add}(\text{Mul}(x, y), x)
 \end{array}$$

Cons-free Term Rewriting:

- symbols are split into **data** and **function** symbols

Cons-free Term Rewriting:

- symbols are split into **data** and **function** symbols
- right-hand sides create no new **data**:

Cons-free Term Rewriting:

- symbols are split into **data** and **function** symbols
- right-hand sides create no new **data**:
 - right-hand sides *may* contain terms exclusively built of constructors (e.g. True, False, S(0))

Cons-free Term Rewriting:

- symbols are split into **data** and **function** symbols
- right-hand sides create no new **data**:
 - right-hand sides *may* contain terms exclusively built of constructors (e.g. True, False, S(0))
 - right-hand sides *may* contain subterms of their left-hand side (to allow for pattern matching)

Cons-free Term Rewriting:

- symbols are split into **data** and **function** symbols
- right-hand sides create no new **data**:
 - right-hand sides *may* contain terms exclusively built of constructors (e.g. True, False, S(0))
 - right-hand sides *may* contain subterms of their left-hand side (to allow for pattern matching)
 - right-hand sides *may not* contain data symbols otherwise

Cons-free Term Rewriting:

- symbols are split into **data** and **function** symbols
- right-hand sides create no new **data**:
 - right-hand sides *may* contain terms exclusively built of constructors (e.g. True, False, S(0))
 - right-hand sides *may* contain subterms of their left-hand side (to allow for pattern matching)
 - right-hand sides *may not* contain data symbols otherwise

$$\mathbf{Hd}(h;t) \rightarrow h$$

$$\mathbf{Tl}(h;t) \rightarrow t$$

Cons-free Term Rewriting:

- symbols are split into **data** and **function** symbols
- right-hand sides create no new **data**:
 - right-hand sides *may* contain terms exclusively built of constructors (e.g. True, False, S(0))
 - right-hand sides *may* contain subterms of their left-hand side (to allow for pattern matching)
 - right-hand sides *may not* contain data symbols otherwise

Evenlength(l) \rightarrow Helper(l , True)

Helper(\square , b) \rightarrow b

Helper($h;t$, True) \rightarrow Helper(t , False)

Helper($h;t$, False) \rightarrow Helper(t , True)

Cons-free Term Rewriting:

- symbols are split into **data** and **function** symbols
- right-hand sides create no new **data**:
 - right-hand sides *may* contain terms exclusively built of constructors (e.g. True, False, S(0))
 - right-hand sides *may* contain subterms of their left-hand side (to allow for pattern matching)
 - right-hand sides *may not* contain data symbols otherwise

$$\text{Half}(0) \rightarrow 0$$

Answer:

YES

Overview

- 1 Motivation
- 2 First-order Term Rewriting
- 3 Characterising PTIME
- 4 Call-by-value Rewriting**
- 5 Other Restrictions
- 6 Conclusions

Call-by-value term rewriting characterises PTIME

Call-by-value term rewriting characterises PTIME

- any algorithm in PTIME can be implemented by a cons-free TRS with call-by-value reduction

Call-by-value term rewriting characterises PTIME

- any algorithm in PTIME can be implemented by a cons-free TRS with call-by-value reduction
- for any cons-free TRS with call-by-value reduction, there is an algorithm in PTIME which, given s_1, \dots, s_n , determines whether $\text{Start}(s_1, \dots, s_n) \rightarrow^* \text{True}$

Call-by-value term rewriting characterises PTIME

- any algorithm in PTIME can be implemented by a cons-free TRS with call-by-value reduction
- for any cons-free TRS with call-by-value reduction, there is an algorithm in PTIME which, given s_1, \dots, s_n , determines whether $\text{Start}(s_1, \dots, s_n) \rightarrow^* \text{True}$

Constructing an algorithm

Constructing an algorithm

Rules:

- make a list of all statements $f(t_1, \dots, t_m) \rightarrow^* \{\}$ with $\vec{t} \in \mathcal{B}$

Repeat:

- find all u such that $f(t_1, \dots, t_m) \rightarrow_{\mathcal{R}} u$
- simplify u using “confirmed steps”

Algorithm: formal description

Given: TRS with rules \mathcal{R}

Input: start term $\text{Start}(s_1, \dots, s_n)$ with s_1, \dots, s_n data

Intended output: true if $\text{Start}(s_1, \dots, s_n) \rightarrow_{\mathcal{R}}^*$ True or false if not

Initialisation:

- let \mathcal{B} contain all subterms of s and data subterms of rule right-hand sides
- make a list of all statements $f(t_1, \dots, t_m) \rightarrow^* \{ \}$ with $\vec{t} \in \mathcal{B}$

Repeat:

- find all u such that $f(t_1, \dots, t_m) \rightarrow_{\mathcal{R}} u$
- simplify u using “confirmed steps”
- if u simplifies to data q , include q in the set

Algorithm: formal description

Given: TRS with rules \mathcal{R}

Input: start term $\text{Start}(s_1, \dots, s_n)$ with s_1, \dots, s_n data

Intended output: true if $\text{Start}(s_1, \dots, s_n) \rightarrow_{\mathcal{R}}^*$ True or false if not

Initialisation:

- let \mathcal{B} contain all subterms of s and data subterms of rule right-hand sides
- make a list of all statements $f(t_1, \dots, t_m) \rightarrow^* \{ \}$ with $\vec{t} \in \mathcal{B}$

Repeat:

- find all u such that $f(t_1, \dots, t_m) \rightarrow_{\mathcal{R}} u$
- simplify u using “confirmed steps”
- if u simplifies to data q , include q in the set

Conclusion:

- stop when no new elements are added to sets

Algorithm: formal description

Given: TRS with rules \mathcal{R}

Input: start term $\text{Start}(s_1, \dots, s_n)$ with s_1, \dots, s_n data

Intended output: true if $\text{Start}(s_1, \dots, s_n) \rightarrow_{\mathcal{R}}^* \text{True}$ or false if not

Initialisation:

- let \mathcal{B} contain all subterms of s and data subterms of rule right-hand sides
- make a list of all statements $f(t_1, \dots, t_m) \rightarrow^* \{\}$ with $\vec{t} \in \mathcal{B}$

Repeat:

- find all u such that $f(t_1, \dots, t_m) \rightarrow_{\mathcal{R}} u$
- simplify u using “confirmed steps”
- if u simplifies to data q , include q in the set

Conclusion:

- stop when no new elements are added to sets
- return true if and only if $\text{Start}(s_1, \dots, s_n) \rightarrow^* A \cup \{\text{True}\}$

Conclusion:

Conclusion:

- call-by-value term rewriting characterises PTIME

Conclusion:

- call-by-value term rewriting characterises PTIME
- innermost term rewriting characterises PTIME

Conclusion:

- call-by-value term rewriting characterises PTIME
- innermost term rewriting characterises PTIME

Note: non-determinism does not increase expressivity

Conclusion:

- call-by-value term rewriting characterises PTIME
- innermost term rewriting characterises PTIME

Note: non-determinism does not increase expressivity
(see also: Cook '71, Bonfante '06)

Overview

- 1 Motivation
- 2 First-order Term Rewriting
- 3 Characterising PTIME
- 4 Call-by-value Rewriting
- 5 Other Restrictions**
- 6 Conclusions

Recall:

Recall: any algorithm in PTIME can be implemented by a **deterministic** cons-free TRS **with call-by-value reduction**

Recall: any algorithm in PTIME can be implemented by a **deterministic** cons-free TRS **with call-by-value reduction**

Question:

does **deterministic** term rewriting characterise PTIME?

Recall: any algorithm in PTIME can be implemented by a **deterministic** cons-free TRS **with call-by-value reduction**

Question:

does **deterministic** term rewriting characterise PTIME?

Answer:

YES

Recall: any algorithm in PTIME can be implemented by a **deterministic** cons-free TRS **with call-by-value reduction**

Question:

does **deterministic** term rewriting characterise PTIME?

Answer:

YES

Proof:

Recall: any algorithm in PTIME can be implemented by a **deterministic** cons-free TRS **with call-by-value reduction**

Question:

does **deterministic** term rewriting characterise PTIME?

Answer:

YES

Proof:

suppose $\rightarrow_{\mathcal{R}}^*$ has unique normal forms

Recall: any algorithm in PTIME can be implemented by a **deterministic** cons-free TRS **with call-by-value reduction**

Question:

does **deterministic** term rewriting characterise PTIME?

Answer:

YES

Proof:

suppose $\rightarrow_{\mathcal{R}}^*$ has unique normal forms
then

Recall: any algorithm in PTIME can be implemented by a **deterministic** cons-free TRS with **call-by-value reduction**

Question:

does **deterministic** term rewriting characterise PTIME?

Answer:

YES

Proof:

suppose $\rightarrow_{\mathcal{R}}^*$ has unique normal forms
then

$s \rightarrow_{\mathcal{R}}^* t$ with t data if and only if $s \rightarrow_{\mathcal{R}, \text{call-by-value}}^* t$

Recall: any algorithm in PTIME can be implemented by a **deterministic** cons-free TRS **with call-by-value reduction**

Question:

does **deterministic** term rewriting characterise PTIME?

Answer:

YES

Proof:

suppose $\rightarrow_{\mathcal{R}}^*$ has unique normal forms

then **exists \mathcal{R}' such that**

$s \rightarrow_{\mathcal{R}}^* t$ with t data if and only if $s \rightarrow_{\mathcal{R}', \text{call-by-value}}^* t$

Recall: any algorithm in PTIME can be implemented by a **deterministic** cons-free TRS with **call-by-value reduction**

Question:

does **deterministic** term rewriting characterise PTIME?

Answer:

YES

Proof:

suppose $\rightarrow_{\mathcal{R}}^*$ has unique normal forms
 then **exists \mathcal{R}' such that**
 $s \rightarrow_{\mathcal{R}}^* t$ with t data if and only if $s \rightarrow_{\mathcal{R}', \text{call-by-value}}^* t$
(in a cons-free TRS)

Semi-Linear Term Rewriting

(adapted from [Carvalho and Simonsen '14])

Semi-Linear Term Rewriting

(adapted from [Carvalho and Simonsen '14])

Definition:

a rule $f(\ell_1, \dots, \ell_n) \rightarrow r$ is **semi-linear** if:

Semi-Linear Term Rewriting

(adapted from [Carvalho and Simonsen '14])

Semi-Linear Term Rewriting

Definition:

a rule $f(\ell_1, \dots, \ell_n) \rightarrow r$ is **semi-linear** if:
for each ℓ_i :

if ℓ_i is a variable then ℓ_i occurs at most once in r

Claim:

rewriting with **semi-linear** rules characterises PTIME

Proof:

- same algorithm as for innermost can be expressed semi-linear
- if all rules in \mathcal{R} are semi-linear
then exists \mathcal{R}' such that
 $s \rightarrow_{\mathcal{R}}^* t$ with t data if and only if $s \rightarrow_{\mathcal{R}', \text{call-by-value}}^* t$

Semi-Linear Term Rewriting

Definition:

a rule $f(\ell_1, \dots, \ell_n) \rightarrow r$ is **semi-linear** if:

for each ℓ_i :

if ℓ_i is a variable then ℓ_i occurs at most once in r

Claim:

rewriting with **semi-linear** rules characterises PTIME

Proof:

- same algorithm as for innermost can be expressed semi-linear
- if all rules in \mathcal{R} are semi-linear
 then let $\mathcal{R}' = \mathcal{R} \cup \{f(x_1, \dots, x_n) \rightarrow \perp \mid f \text{ a function symbol}\}$
 then $s \rightarrow_{\mathcal{R}}^* t$ with t data if and only if $s \rightarrow_{\mathcal{R}', \text{call-by-value}}^* t$

Semi-Linear Term Rewriting

Definition:

a rule $f(\ell_1, \dots, \ell_n) \rightarrow r$ is **semi-linear** if:
for each ℓ_i :

if ℓ_i is a variable then ℓ_i occurs at most once in r

Claim:

rewriting with **confluent** rules characterises PTIME

Proof:

- same algorithm as for innermost **is confluent**
- if all rules in \mathcal{R} are **confluent**
then let $\mathcal{R}' = \mathcal{R} \cup \{f(x_1, \dots, x_n) \rightarrow \perp \mid f \text{ a function symbol}\}$
then $s \rightarrow_{\mathcal{R}}^* t$ with t data if and only if $s \rightarrow_{\mathcal{R}', \text{call-by-value}}^* t$

“Constrained” Term Rewriting [Carvalho and Simonsen '14]

“Constrained” Term Rewriting [Carvalho and Simonsen '14]

Definition: there is $\mathcal{A} \subseteq \mathcal{F}$ such that:

- all rules $f(\ell_1, \dots, \ell_n) \rightarrow r$ with $f \in \mathcal{A}$ are semi-linear
- for all rules $f(\ell_1, \dots, \ell_n) \rightarrow r$ with $f \notin \mathcal{A}$: if ℓ_i is a variable, and $r = C[g(t_1, \dots, D[\ell_i], \dots, t_m)]$ then $g \in \mathcal{A}$

“Constrained” Term Rewriting [Carvalho and Simonsen '14]

Definition: there is $\mathcal{A} \subseteq \mathcal{F}$ such that:

- all rules $f(\ell_1, \dots, \ell_n) \rightarrow r$ with $f \in \mathcal{A}$ are semi-linear
- for all rules $f(\ell_1, \dots, \ell_n) \rightarrow r$ with $f \notin \mathcal{A}$: if ℓ_i is a variable, and $r = C[g(t_1, \dots, D[\ell_i], \dots, t_m)]$ then $g \in \mathcal{A}$

\implies easily adapted to a system with only semi-linear rules

“Constrained” Term Rewriting [Carvalho and Simonsen '14]

Definition: there is $\mathcal{A} \subseteq \mathcal{F}$ such that:

- all rules $f(\ell_1, \dots, \ell_n) \rightarrow r$ with $f \in \mathcal{A}$ are semi-linear
- for all rules $f(\ell_1, \dots, \ell_n) \rightarrow r$ with $f \notin \mathcal{A}$: if ℓ_i is a variable, and $r = C[g(t_1, \dots, D[\ell_i], \dots, t_m)]$ then $g \in \mathcal{A}$

\implies easily adapted to a system with only semi-linear rules

\implies easily adapted to a system on which call-by-value rewriting can be imposed

Overview

- 1 Motivation
- 2 First-order Term Rewriting
- 3 Characterising PTIME
- 4 Call-by-value Rewriting
- 5 Other Restrictions
- 6 Conclusions**

Results:

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (including non-determinism)

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (including non-determinism)
- we showed that this characterisation can be used as a **tool**:

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (including non-determinism)
- we showed that this characterisation can be used as a **tool**:
 - simplified proof of [Carvalho and Simonsen '14] through a transformation to call-by-value term rewriting

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (including non-determinism)
- we showed that this characterisation can be used as a **tool**:
 - simplified proof of [Carvalho and Simonsen '14] through a transformation to call-by-value term rewriting
 - suitability of other constraints on term rewriting might be proved similarly

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (including non-determinism)
- we showed that this characterisation can be used as a **tool**:
 - simplified proof of [Carvalho and Simonsen '14] through a transformation to call-by-value term rewriting
 - suitability of other constraints on term rewriting might be proved similarly

Future work:

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (**including non-determinism**)
- we showed that this characterisation can be used as a **tool**:
 - simplified proof of [Carvalho and Simonsen '14] through a transformation to call-by-value term rewriting
 - suitability of other constraints on term rewriting might be proved similarly

Future work:

- extension to higher-order rewriting (transposing **all** of [Jones '01])

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (**including non-determinism**)
- we showed that this characterisation can be used as a **tool**:
 - simplified proof of [Carvalho and Simonsen '14] through a transformation to call-by-value term rewriting
 - suitability of other constraints on term rewriting might be proved similarly

Future work:

- extension to higher-order rewriting (transposing **all** of [Jones '01])
- considering other constraints and no constraints

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (**including non-determinism**)
- we showed that this characterisation can be used as a **tool**:
 - simplified proof of [Carvalho and Simonsen '14] through a transformation to call-by-value term rewriting
 - suitability of other constraints on term rewriting might be proved similarly

Future work:

- extension to higher-order rewriting (transposing **all** of [Jones '01])
- considering other constraints and **no constraints** (**submitted to FSCD'16**)

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (**including non-determinism**)
- we showed that this characterisation can be used as a **tool**:
 - simplified proof of [Carvalho and Simonsen '14] through a transformation to call-by-value term rewriting
 - suitability of other constraints on term rewriting might be proved similarly

Future work:

- extension to higher-order rewriting (transposing **all** of [Jones '01])
- considering other constraints and no constraints (**submitted to FSCD'16**)
- finding constraints which can **not** be transposed to call-by-value rewriting

Results:

- we transposed the characterisation of PTIME in [Jones '01] to **call-by-value** term rewriting (**including non-determinism**)
- we showed that this characterisation can be used as a **tool**:
 - simplified proof of [Carvalho and Simonsen '14] through a transformation to call-by-value term rewriting
