A 0/1 polytope P is the polytope of a matroid if and only if:

- every edge of P is a translate of $e_i e_j$, for some i, j,
- there exists a submodular rank function $r: 2^E \mapsto \mathbb{N}$ s.t.:

$$P = P_r := \{ \mathsf{x} \in \mathbb{R}^E : \sum_{i \in U} x_i \leq r(U) \ \forall U \subset E \land \sum_{i \in E} x_i = r(E) \}.$$

Gel'fand, Goresky, MacPherson, Serganova 1987

 From the basis exchange axiom, the distance between two bases A and B is exactly |AΔB|/2.

- From the basis exchange axiom, the distance between two bases A and B is exactly $|A\Delta B|/2$.
- The diameter $\delta(P_M)$ is therefore (half) the maximum symmetric difference between two bases.

- From the basis exchange axiom, the distance between two bases A and B is exactly |AΔB|/2.
- The diameter $\delta(P_M)$ is therefore (half) the maximum symmetric difference between two bases.
- Can be computed in polynomial time using the Matroid Union theorem and Edmonds' Matroid partition algorithm.

Edmonds 1965

Graph associahedra and elimination trees

When $H = (V, \mathcal{E})$ is the graphical building set of a graph G = (V, E):

 $\mathcal{E} := \{ S \subseteq V : G[S] \text{ is connected} \},\$

then the hypergraphic polytope P_H of H is the graph associahedron of G.

- Vertices of P_H are one-to-one with elimination trees of G,
- and the skeleton of P_H is the rotation graph on elimination trees of G.
