The Multicommodity-Ring Location Routing Problem

An instance: scenario and demands

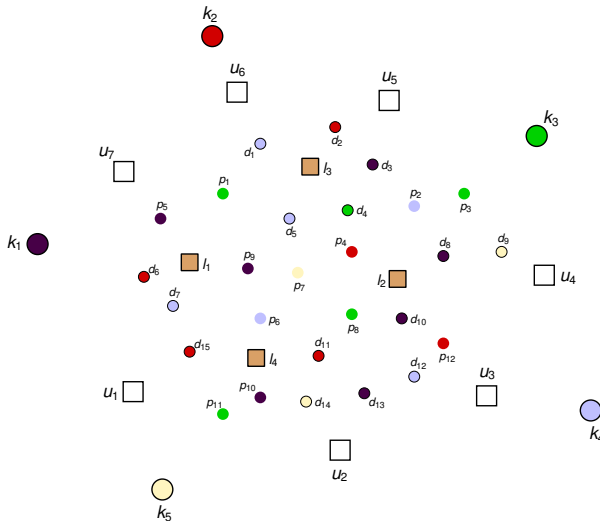

Figure 1: A MRLRP instance: gates, sites, delivery and pickup demands, SPLs

The Multicommodity-Ring Location Routing Problem

An instance: solution

Figure 2: A solution to the previous instance

The Multicommodity-Ring Location Routing Problem

Problem definition

Gates

Sources/destinations of delivery/pick-up goods

The Multicommodity-Ring Location Routing Problem

Problem definition

Gates

Sources/destinations of delivery/pick-up goods

Ring

- ▶ UDCs with fixed installation cost and capacity
- ▶ ring arcs with
 - ▶ fixed installation cost and capacity
 - ▶ per-load-unit transportation cost

The Multicommodity-Ring Location Routing Problem

Problem definition

Gates

Sources/destinations of delivery/pick-up goods

Ring

- ▶ UDCs with fixed installation cost and capacity
- ▶ ring arcs with
 - ▶ fixed installation cost and capacity
 - ▶ per-load-unit transportation cost

Routing

- ▶ vehicles with maximum load and trip length
- ▶ separate service of pickup and delivery demands
- ▶ service routes may be open
 - ⇒ SPLs are additional ending points ⇒ same fleet for UDCs and SPLs
 - ⇒ fleet rebalancing constraints on SPLs and UDCs

The Multicommodity-Ring Location Routing Problem

Problem definition

Strategic analysis

- ▶ Time-independent scenario
- ▶ Goods type is not considered

The Multicommodity-Ring Location Routing Problem

Problem definition

Strategic analysis

- ▶ Time-independent scenario
- ▶ Goods type is not considered

Decisions

- ▶ install UDCs and ring
- ▶ gates-UDCs, ring flows
- ▶ demands assignment to UDCs

The Multicommodity-Ring Location Routing Problem

Problem definition

Strategic analysis

- ▶ Time-independent scenario
- ▶ Goods type is not considered

Decisions

- ▶ install UDCs and ring
- ▶ gates-UDCs, ring flows
- ▶ demands assignment to UDCs

Objective function

Minimize the sum of:

- ▶ installation costs
- ▶ flow transportation costs
- ▶ routing costs

MILP model for MRLRP

Decision variables

1. **ring** variables $y_u \in \{0, 1\}$, $z_{uv} \in \{0, 1\}$
2. **service** variables $\chi_{ku} \in \{0, 1\}$
3. **second-level routing** variables $x_r \in \{0, 1\}$
4. **first-level flow** variables
 - ▶ $\varphi_{ku} \geq 0$, $\varphi_{uk} \geq 0$ (gates-UDCs flows)
 - ▶ $\varphi_{uv}^{dk} \geq 0$, $\varphi_{uv}^{pk} \geq 0$ (ring flows)
 - ▶ $\phi_{ku} \geq 0$, $\phi_{uk} \geq 0$ (UDC capacity upper bound)

MILP model for MRLRP

Decision variables

1. **ring** variables $y_u \in \{0, 1\}$, $z_{uv} \in \{0, 1\}$
2. **service** variables $\chi_{ku} \in \{0, 1\}$
3. **second-level routing** variables $x_r \in \{0, 1\}$
4. **first-level flow** variables $\varphi_{ku} \geq 0$, $\varphi_{uk} \geq 0$, $\varphi_{uv}^{dk} \geq 0$, $\varphi_{uv}^{pk} \geq 0$, $\phi_{ku} \geq 0$, $\phi_{uk} \geq 0$

Objective function

$$\min \sum_{u \in U} F_u y_u + \sum_{\substack{u \in U \\ k \in K}} (c_{ku} \varphi_{ku} + c_{uk} \varphi_{uk}) + \sum_{uv \in A_U} g_{uv} z_{uv} + \sum_{\substack{uv \in A_U \\ k \in K}} c_{uv} (\varphi_{uv}^{pk} + \varphi_{uv}^{dk}) + \sum_{r \in \mathcal{R}} c(r) x_r$$

Cost terms:

- ▶ UDC installation
- ▶ UDC-gates flows
- ▶ ring installation
- ▶ ring flows
- ▶ Second level routing

MILP model for MRLRP

Objective function

$$\min \sum_{u \in U} F_u y_u + \sum_{\substack{u \in U \\ k \in K}} (c_{ku} \varphi_{ku} + c_{uk} \varphi_{uk}) + \sum_{uv \in A_U} g_{uv} z_{uv} + \sum_{\substack{uv \in A_U \\ k \in K}} c_{uv} (\varphi_{uv}^{pk} + \varphi_{uv}^{dk}) + \sum_{r \in \mathcal{R}} c(r) x_r$$

Constraints

$$\begin{aligned} \text{s.t. } \sum_{u \in U} \varphi_{ku} &= \sum_{i \in D_k} q_i && \forall k \in K && \text{gates-UDC flows} \\ \sum_{u \in U} \varphi_{uk} &= \sum_{i \in P_k} q_i && \forall k \in K \\ \varphi_{uk} + \varphi_{ku} &\leq \chi_{ku} \sum_{i \in P_k \cup D_k} q_i && \forall k \in K, u \in U \\ \chi_{ku} &\leq y_u && \forall k \in K, u \in U \\ \sum_{u \in U} \chi_{ku} &\leq B && \forall k \in K \\ \varphi_{ku} + \sum_{v \in U \setminus u} \varphi_{vu}^{dk} &= \sum_{v \in U \setminus u} \varphi_{uv}^{dk} + \sum_{r \in \mathcal{R}_u^{+d}} q_k(r) x_r && \forall k \in K, u \in U && \text{UDC flow conservation} \\ \sum_{r \in \mathcal{R}_u^{-p}} q_k(r) x_r + \sum_{v \in U \setminus u} \varphi_{vu}^{pk} &= \sum_{v \in U \setminus u} \varphi_{uv}^{pk} + \varphi_{uk} && \forall k \in K, u \in U \end{aligned}$$

MILP model for MRLRP

Objective function

$$\min \sum_{u \in U} F_u y_u + \sum_{\substack{u \in U \\ k \in K}} (c_{ku} \varphi_{ku} + c_{uk} \varphi_{uk}) + \sum_{uv \in A_U} g_{uv} z_{uv} + \sum_{\substack{uv \in A_U \\ k \in K}} c_{uv} (\varphi_{uv}^{pk} + \varphi_{uv}^{dk}) + \sum_{r \in \mathcal{R}} c(r) x_r$$

Constraints

$$\begin{aligned} \text{s.t. } \sum_{r \in \mathcal{R}_i} x_r &= 1 & \forall i \in P \cup D & \text{demands service} \\ x_r \leq y_u &\leq \sum_{r \in \mathcal{R}_u^{+d}} x_r + \sum_{r \in \mathcal{R}_u^{-p}} x_r & \forall r \in \mathcal{R}_u^+ \cup \mathcal{R}_u^-, u \in U & \text{logical constraints} \\ -\delta_h^- &\leq \sum_{r \in \mathcal{R}_h^-} x_r - \sum_{r \in \mathcal{R}_h^+} x_r \leq \delta_h^+ & \forall h \in U \cup L & \text{fleet rebalancing} \\ \sum_{\substack{v \in U \\ u < v}} z_{uv} + \sum_{\substack{v \in U \\ v < u}} z_{vu} &= 2y_u & \forall u \in U & \text{SEC} \\ \sum_{\substack{u \in S \\ v \notin S \\ u < v}} z_{uv} + \sum_{\substack{u \notin S \\ v \in S \\ u < v}} z_{uv} &\geq 2(y_w + y_{w'} - 1) & \forall S \in \mathcal{S}_U, w \in S, w' \in U \setminus S & \end{aligned}$$

MILP model for MRLRP

Objective function

$$\min \sum_{u \in U} F_u y_u + \sum_{\substack{u \in U \\ k \in K}} (c_{ku} \varphi_{ku} + c_{uk} \varphi_{uk}) + \sum_{uv \in A_U} g_{uv} z_{uv} + \sum_{\substack{uv \in A_U \\ k \in K}} c_{uv} (\varphi_{uv}^{pk} + \varphi_{uv}^{dk}) + \sum_{r \in \mathcal{R}} c(r) x_r$$

Constraints

$$\begin{aligned} \text{s.t. } & \sum_{k \in K} (\varphi_{uv}^{dk} + \varphi_{uv}^{pk}) \leq q_{uv} z_{uv} & \forall (u, v) \in A'_U & \text{ring arcs capacity} \\ & \sum_{k \in K} (\varphi_{vu}^{dk} + \varphi_{vu}^{pk}) \leq q_{vu} z_{uv} & \forall (u, v) \in A'_U & \\ & \sum_{k \in K} (\phi_{ku} + \varphi_{ku} + \phi_{uk} + \varphi_{uk}) \leq Q_u y_u & \forall u \in U & \text{UDC capacity} \\ & \phi_{ku} \geq \sum_{r \in \mathcal{R}_u^{+d}} q_k(r) x_r - \varphi_{ku} & \forall k \in K, u \in U & \\ & \phi_{uk} \geq \sum_{r \in \mathcal{R}_u^{-p}} q_k(r) x_r - \varphi_{uk} & \forall k \in K, u \in U & \\ & \sum_{u \in U} y_u \leq N & & \text{budget constraint} \end{aligned}$$

$$y_u, z_{uv}, x_{ku}, x_r \in \{0, 1\}, \varphi_{uv}^{pk}, \varphi_{uv}^{dk}, \varphi_{ku}, \varphi_{uk}, \phi_{uk}, \phi_{ku} \geq 0$$

The GALW Matheuristic

A Four-stage Decomposition Heuristic

1-Route Generator

Generation of a **set of delivery/pick-up service routes**

▶ construction + local search

The GALW Matheuristic

A Four-stage Decomposition Heuristic

1–Route Generator

Generation of a **set of delivery/pick-up service routes**

- ▶ construction + local search

2–Assignment Subproblem

Solution of a **MILP assignment subproblem** to:

- ▶ choose a **subset of UDC**
- ▶ **assign demands** to UDCs at both first and second level
- ▶ **constraints**: fleet balance, UDCs capacity

The GALW Matheuristic

A Four-stage Decomposition Heuristic

1–Route Generator

Generation of a **set of delivery/pick-up service routes**

- ▶ construction + local search

2–Assignment Subproblem

Solution of a **MILP assignment subproblem** to:

- ▶ choose a **subset of UDC**
- ▶ **assign demands** to UDCs at both first and second level
- ▶ **constraints**: fleet balance, UDCs capacity

3–Ring Construction

The chosen UDCs are connected by solving a **Symmetric TSP**

The GALW Matheuristic

A Four-stage Decomposition Heuristic

1–Route Generator

Generation of a **set of delivery/pick-up service routes**

- ▶ construction + local search

2–Assignment Subproblem

Solution of a **MILP assignment subproblem** to:

- ▶ choose a **subset of UDC**
- ▶ **assign demands** to UDCs at both first and second level
- ▶ **constraints**: fleet balance, UDCs capacity

3–Ring Construction

The chosen UDCs are connected by solving a **Symmetric TSP**

4–Ring MultiFlow Subproblem

Solution of a **LP ring multiflow with capacities and demands** problem

- ▶ routing of **indirect shipments**

GALW: a Matheuristic Approach

Stage 1: Route Generator

Generation of a route m

- ▶ **first demand: random choice** of one with a less-than-average # of visits
- ▶ **nearest neighbor** step considering both head and tail insertion:

$$d' = \arg \min_{d \in D \setminus m} p_Q \frac{q(m) + q(d)}{Q} + p_C \frac{c(m) + c(d)}{C} + p_w \frac{\omega(d)}{\gamma}$$

- ▶ **2-opt local search**
- ▶ generation of m ends when no more demands can be added

GALW: a Matheuristic Approach

Stage 1: Route Generator

Generation of a route m

- ▶ **first demand**: **random choice** of one with a less-than-average # of visits
- ▶ **nearest neighbor** step considering both head and tail insertion:

$$d' = \arg \min_{d \in D \setminus m} p_Q \frac{q(m) + q(d)}{Q} + p_C \frac{c(m) + c(d)}{C} + p_\omega \frac{\omega(d)}{\gamma}$$

- ▶ **2-opt local search**
- ▶ generation of m ends when no more demands can be added

How to obtain a *good* route set $\overline{\mathcal{R}}$

- ▶ many route **subsets** $\overline{\mathcal{R}}^t$ with different **maximal length**
- ▶ each demand is served by **at least ω** feasible sequences of demands **per route subset**
- ▶ endpoints combination

GALW: a Matheuristic Approach

Stage 2: Assignment Subproblem

Decision variables

1. **UDC** variables $y_u \in \{0, 1\}$
2. **service** variables $\chi_{ku} \in \{0, 1\}$
3. **second-level routing** variables $x_r \in \{0, 1\}$
4. **first-level flow** variables
 - ▶ $\varphi_{ku} \geq 0, \varphi_{uk} \geq 0$ (gates-UDCs flows)
 - ▶ $\phi_{ku} \geq 0, \phi_{uk} \geq 0$ (UDC capacity upper bound)

GALW: a Matheuristic Approach

Stage 2: Assignment Subproblem

Decision variables

1. **UDC** variables $y_u \in \{0, 1\}$
2. **service** variables $\chi_{ku} \in \{0, 1\}$
3. **second-level routing** variables $x_r \in \{0, 1\}$
4. **first-level flow** variables $\varphi_{ku} \geq 0, \varphi_{uk} \geq 0, \phi_{ku} \geq 0, \phi_{uk} \geq 0$

Objective function

$$\min \sum_{u \in U} F_u y_u + \sum_{\substack{u \in U \\ k \in K}} (c_{ku} \varphi_{ku} + c_{uk} \varphi_{uk}) + \sum_{r \in \mathcal{R}} c(r) x_r + \sum_{\substack{u \in U \\ o=3 \dots N}} F_{u,o} \xi_o^u + \sum_{\substack{u \in U \\ k \in K}} \bar{c}_u f_\phi(\phi_{ku}, \phi_{uk})$$

Cost terms:

- ▶ **UDC** installation
- ▶ **UDC-gates** flows
- ▶ **Second level routing**
- ▶ **Ring construction** costs estimate
- ▶ **Ring flows** costs estimate

GALW: a Matheuristic Approach

Stage 2: Assignment Subproblem

Objective function

$$\min \sum_{u \in U} F_u y_u + \sum_{\substack{u \in U \\ k \in K}} (c_{ku} \varphi_{ku} + c_{uk} \varphi_{uk}) + \sum_{r \in \mathcal{R}} c(r) x_r + \sum_{\substack{u \in U \\ o=3 \dots N}} F_{u,o} \xi_o^u + \sum_{\substack{u \in U \\ k \in K}} \bar{c}_u f_\phi(\phi_{ku}, \phi_{uk})$$

Constraints

$$\text{s.t. } \sum_{u \in U} \varphi_{ku} = \sum_{i \in D_k} q_i \quad \forall k \in K \quad \text{gates-UDC flows}$$

$$\sum_{u \in U} \varphi_{uk} = \sum_{i \in P_k} q_i \quad \forall k \in K$$

$$\varphi_{uk} + \varphi_{ku} \leq \chi_{ku} \sum_{i \in P_k \cup D_k} q_i \quad \forall k \in K, u \in U$$

$$\chi_{ku} \leq y_u \quad \forall k \in K, u \in U$$

$$\sum_{u \in U} \chi_{ku} \leq B \quad \forall k \in K$$

$$\sum_{r \in \mathcal{R}_i} x_r = 1 \quad \forall i \in P \cup D \quad \text{demands service}$$

$$x_r \leq y_u \leq \sum_{r \in \mathcal{R}_u^+} x_r + \sum_{r \in \mathcal{R}_u^-} x_r \quad \forall r \in \mathcal{R}_u^+ \cup \mathcal{R}_u^-, u \in U \quad \text{logical constraints}$$

$$\sum_{u \in U} y_u \leq N \quad \text{budget constraint}$$

GALW: a Matheuristic Approach

Stage 2: Assignment Subproblem

Objective function

$$\min \sum_{u \in U} F_u y_u + \sum_{\substack{u \in U \\ k \in K}} (c_{ku} \varphi_{ku} + c_{uk} \varphi_{uk}) + \sum_{r \in \mathcal{R}} c(r) x_r + \sum_{\substack{u \in U \\ o=3 \dots N}} F_{u,o} \xi_o^u + \sum_{\substack{u \in U \\ k \in K}} \bar{c}_u f_\phi(\phi_{ku}, \phi_{uk})$$

Constraints

s.t. $-\delta_h^- \leq \sum_{r \in \mathcal{R}_h^-} x_r - \sum_{r \in \mathcal{R}_h^+} x_r \leq \delta_h^+ \quad \forall h \in U \cup L$ fleet rebalancing

$\sum_{k \in K} (\phi_{ku} + \varphi_{ku} + \phi_{uk} + \varphi_{uk}) \leq Q_u y_u \quad \forall u \in U$ UDC capacity

$\phi_{ku} \geq \sum_{r \in \mathcal{R}_u^{+d}} q_k(r) x_r - \varphi_{ku} \quad \forall k \in K, u \in U$

$\phi_{uk} \geq \sum_{r \in \mathcal{R}_u^{-p}} q_k(r) x_r - \varphi_{uk} \quad \forall k \in K, u \in U$

$\sum_{k \in K} f_\phi(\phi_{ku}, \phi_{uk}) \leq \bar{q}_u y_u \quad \forall u \in U$ outgoing flows bound

$\xi_o^u = f_\xi(y_u : u \in U) \quad \forall u \in U, o \in \{3, \dots, N\}$ ring estimate

$y_u, z_{uv}, x_{ku}, x_r \in \{0, 1\}, \varphi_{ku}, \varphi_{uk}, \phi_{uk}, \phi_{ku} \geq 0$

Computational Results

MRLRP instances

Derived from **benchmark CLRP instances** taken from [5] with MRLRP additional features

- [5] C.Prins, C.Prodhon, R.Wolfler Calvo, *Solving the capacitated location-routing problem by a GRASP complemented by a learning process and a path relinking*. 4OR, 4(3):221–238, 2006.

Computational Results

MRLRP instances

Derived from **benchmark CLRP instances** taken from [5] with MRLRP additional features

[5] C.Prins, C.Prodhon, R.Wolfler Calvo, *Solving the capacitated location-routing problem by a GRASP complemented by a learning process and a path relinking*. 4OR, 4(3):221–238, 2006.

Computational evaluation

- ▶ aim: to establish how:
 - ▶ the **hardness** of an instance is affected its **dimensional features**
 - ▶ the **decomposition** process affects GALW performance
- ▶ **collections** of MRLRP instances, subdivided in **scenarios**:
 - ▶ different scenarios \Rightarrow different $|U|$ or $|K|$ or $|L|$ or $|D| = |P|$
 - ▶ in a scenario: different ring costs

Figure 6: A VRPIRF instance: the depot (blue), the facilities (red), and the customers

VRP with Intermediate Replenishment Facilities (VRPIRF)

Figure 6: A solution to the previous instance: rotation of first vehicle

VRP with Intermediate Replenishment Facilities (VRPIRF)

Figure 6: A solution to the previous instance: rotation of second vehicle

VRP with Intermediate Replenishment Facilities (VRPIRF)

Problem Definition

Actors

- ▶ set of **customers** with a **demand** and a **service time**
- ▶ a **depot**, the base of a fleet of homogeneous **vehicles** with fixed **capacity**
- ▶ a set of **replenishment facilities**, with a **recharge time** each

VRP with Intermediate Replenishment Facilities (VRPIRF)

Problem Definition

Actors

- ▶ set of **customers** with a **demand** and a **service time**
- ▶ a **depot**, the base of a fleet of homogeneous **vehicles** with fixed **capacity**
- ▶ a set of **replenishment facilities**, with a **recharge time** each

Distinctive Features

- ▶ **multi-trip**: vehicles can **replenish** at facilities when empty \Rightarrow **rotation**
- ▶ the depot has no replenishment purposes
- ▶ a vehicle's rotation must:
 - ▶ **start and end** at the depot
 - ▶ not exceed a given **maximum shift length**

VRP with Intermediate Replenishment Facilities (VRPIRF)

Problem Definition

Actors

- ▶ set of **customers** with a **demand** and a **service time**
- ▶ a **depot**, the base of a fleet of homogeneous **vehicles** with fixed **capacity**
- ▶ a set of **replenishment facilities**, with a **recharge time** each

Distinctive Features

- ▶ **multi-trip**: vehicles can **replenish** at facilities when empty \Rightarrow **rotation**
- ▶ the depot has no replenishment purposes
- ▶ a vehicle's rotation must:
 - ▶ **start and end** at the depot
 - ▶ not exceed a given **maximum shift length**

Objective

Find a **minimum-cost set of rotations** that visit each client **exactly once**

Main features of the MILP model for VRPIRF

Replenishment arcs

Replenishment arcs

They represent **stops at facilities to recharge** in between two customers

⇒ no facility nodes

⇒ the depot is the only node with **in/outdegree greater than 1**

⇒ a rotation becomes **very similar to a classical CVRP route**

⇒ **connectivity** of rotations can be **assured in a much stronger way**

Main features of the MILP model for VRPIRF

Replenishment arcs

Replenishment arcs

They represent **stops at facilities to recharge** in between two customers

⇒ no facility nodes

⇒ the depot is the only node with **in/outdegree greater than 1**

⇒ a rotation becomes **very similar to a classical CVRP route**

⇒ **connectivity** of rotations can be **assured in a much stronger way**

Figure 7: The same rotation with replenishment arcs and without.

Main features of the MILP model for VRPIRF

Arrival times

Arrival times

They allow to keep track of time on a partial path from the depot:

$$(\forall i \in C) \sum_{j \in V \setminus \{i\}} z_{ij} = \sum_{j \in V \setminus \{i\}} z_{ji} + \sum_{j \in V \setminus \{i\}} t_{ij} x_{ij} + \sum_{j \in C \setminus \{i\}} u_{ij} w_{ij}; \quad z_{i\Delta} \leq T x_{i\Delta}$$

- ⇒ maximal shift length is enforced **without vehicle index**
- ⇒ dramatic **reduction of symmetry issues**
- ⇒ connectivity of integer solutions as a side effect

Main features of the MILP model for VRPIRF

Arrival times

Arrival times

They allow to keep track of time on a partial path from the depot:

$$(\forall i \in C) \sum_{j \in V \setminus \{i\}} z_{ij} = \sum_{j \in V \setminus \{i\}} z_{ji} + \sum_{j \in V \setminus \{i\}} t_{ij} x_{ij} + \sum_{j \in C \setminus \{i\}} u_{ij} w_{ij}; \quad z_{i\Delta} \leq T x_{i\Delta}$$

- ⇒ maximal shift length is enforced **without vehicle index**
- ⇒ dramatic **reduction of symmetry issues**
- ⇒ connectivity of integer solutions as a side effect

Figure 8: In this rotation, $z_{4\Delta} \leq T$ is sufficient to enforce the maximum shift length.

A MILP 2-Index Formulation for VRPIRF

Decision variables

1. **base arc** variables $x_{ij} \in \{0, 1\}$
2. **replenishment arc** variables $w_{ij} \in \{0, 1\}$
3. **arrival time** variables $z_{ij} \geq 0$

A MILP 2-Index Formulation for VRPIRF

Decision variables

1. **base arc** variables $x_{ij} \in \{0, 1\}$
2. **replenishment arc** variables $w_{ij} \in \{0, 1\}$
3. **arrival time** variables $z_{ij} \geq 0$

Objective function

$$\min \sum_{ij \in A_0} d_{ij} x_{ij} + \sum_{ij \in A_P} f_{ij} w_{ij}$$

A MILP 2-Index Formulation for VRPIRF

Objective function

$$\min \sum_{ij \in A_0} d_{ij} x_{ij} + \sum_{ij \in A_P} f_{ij} w_{ij}$$

Constraints

s.t.	$x(\delta_0^-(\Delta)) + w(A_P) \geq \kappa(C)$		min nr of routes
	$x(\delta_0^+(i)) + w(\delta_P^+(i)) = x(\delta_0^-(i)) + w(\delta_P^-(i))$	$\forall i \in C$	clients service
	$x(\delta_0^+(i)) + w(\delta_P^+(i)) = 1$	$\forall i \in C$	
	$x(\delta_0^-(\Delta)) \leq n_K$		depot degree
	$x(\delta_0^+(\Delta)) = x(\delta_0^-(\Delta))$		
	$x(A_0(S)) \leq S - \kappa(S)$	$\forall S \in \mathcal{S}(C)$	capacity
	$z_{\Delta i} = t_{\Delta i} x_{\Delta i}$	$\forall i \in C$	arrival times
	$(t_{\Delta i} + t_{ij})x_{ij} + (t_{\Delta i} + u_{ij})w_{ij} \leq z_{ij} \leq (T - t_{j\Delta})(x_{ij} + w_{ij})$	$\forall i \in C, j \in C \setminus \{i\}$	
	$\sum_{j \in V \setminus \{i\}} z_{ij} = \sum_{j \in V \setminus \{i\}} z_{ji} + \sum_{j \in V \setminus \{i\}} t_{ij} x_{ij} + \sum_{j \in C \setminus \{i\}} u_{ij} w_{ij}$	$\forall i \in C$	
	$(t_{\Delta i} + t_{i\Delta})x_{i\Delta} \leq z_{i\Delta} \leq T x_{i\Delta}$	$\forall i \in C$	max shift length
	<hr/>		
	$x_{ij}, w_{ij} \in \{0, 1\}, z_{ij} \geq 0$		

Separation

Capacity constraints

Separated as classical capacity constraints on **base arcs only**

- ▶ **solution transformation** to symmetric, one-depot support graph is required
- ▶ separated using **CVRPSEP** (see [18]) routines and imposed as **rounded capacity inequalities** (RCI)

$$x(A_0(S)) \leq |S| - r(S) = |S| - \lceil \frac{1}{Q} \sum_{i \in S} q_i \rceil$$

[18] J.Lysgaard, A.N.Letchford, R.W.Eglese, *A new branch-and-cut algorithm for the capacitated vehicle routing problem*. *Mathematical Programming*, 100(2):423–445, 2004.

Separation

Capacity constraints

Separated as classical capacity constraints on **base arcs only**

- ▶ **solution transformation** to symmetric, one-depot support graph is required
- ▶ separated using **CVRPSEP** (see [18]) routines and imposed as **rounded capacity inequalities** (RCI)

$$x(A_0(S)) \leq |S| - r(S) = |S| - \lceil \frac{1}{Q} \sum_{i \in S} q_i \rceil$$

[18] J.Lysgaard, A.N.Letchford, R.W.Eglese, *A new branch-and-cut algorithm for the capacitated vehicle routing problem*. *Mathematical Programming*, 100(2):423–445, 2004.

Valid inequalities

- ▶ **Connectivity valid inequalities** exploit the rotation structure, imposed as **SECS** on both base and replenishment arcs:

$$(\forall S \in \mathcal{S}(C)) \quad x(A_0(S)) + w(A_P(S)) \leq |S| - 1$$

- ▶ **Multistar inequalities**: given **nucleus** $N \subset C$ and **satellites** $S \subseteq C \setminus N$ (see [19])

$$\alpha(N, S) \sum_{ij \in A(N)} x_{ij} + \beta(N, S) \sum_{ij \in A(C:S)} x_{ij} \leq \gamma(N, S)$$

[19] J.Lysgaard, A.N.Letchford, R.W.Eglese, *Multistars, partial multistars and the capacitated vehicle routing problem*. *Mathematical Programming*, 94(1):21–40, 2002.

Computational Results

Benchmark Instances

- ▶ instances taken from **Crevier et al.** (see [?]) and **Tarantilis et al.** (see [?])
- ▶ features: from 48 to 288 customers, 2 to 7 facilities, 2 to 8 vehicles

Computational Results

Benchmark Instances

- ▶ instances taken from **Crevier et al.** (see [?]) and **Tarantilis et al.** (see [?])
- ▶ features: from 48 to 288 customers, 2 to 7 facilities, 2 to 8 vehicles

Computational Strategy

- ▶ smaller instances (48 to 75 customers):
 - ▶ **complete computation**
 - ▶ time limit: 3600–5400s on both root node and Branch&Bound search
 - ▶ Branch&Bound search fed with the **best known solution** (see [?]) as initial UB
- ▶ bigger instances (96+ customers):
 - ▶ **cutting plane** algorithm at root (time limit: 3600–7200s)
 - ▶ the **gap with the best known solution** is reported

$$\min \sum_{k \in K} \sum_{r \in \mathcal{R}} c_r x_r^k$$

Constraints

$$\begin{aligned} \text{s.t. } & \sum_{r \in \mathcal{R}} \sum_{k \in K} a_r^i x_r^k \geq 1 && \forall i \in C && \text{clients service} \\ & \sum_{r \in \mathcal{R}} a_r^{ip} x_r^k \leq y_p^k \leq \tilde{x}^k && \forall k \in K, p \in F, i \in C && \text{vehicle activity at facilities} \\ & \sum_{r \in \mathcal{R}} (e_r^{ip} - e_r''^{ip}) x_r^k = 0 && \forall k \in K, p \in F && \text{depot degree} \\ & \sum_{r \in \mathcal{R}} t_r x_r^k \leq T \tilde{x}^k && \forall k \in K && \text{max shift length} \\ & \sum_{r \in \mathcal{R}} e_r^{\Delta} x_r^k = \sum_{r \in \mathcal{R}} e_r''^{\Delta} x_r^k = \tilde{x}^k && \forall k \in K && \text{vehicle activity and usage} \\ & \sum_{r \in \mathcal{R}} b_r^{is} x_r^k \geq y_p^k && \forall k \in K, p \in F, s \in S_p && \text{foreconnectivity} \\ & \sum_{r \in \mathcal{R}} b_r''^{is} x_r^k \geq y_p^k && \forall k \in K, p \in F, s \in S_p && \text{backconnectivity} \\ & \hline & \tilde{x}^k, x_r^k, y_p^k \in \{0, 1\} \end{aligned}$$

A MILP Extended Formulation

Main features

Route variables

- ▶ embedded **structural information**
 - ⇒ better representation of connectivity constraints w.r.t. a 3-index compact model
- ▶ on the other hand: they are **in exponential number**
 - ⇒ the solving calls for a **Column Generation** approach

A MILP Extended Formulation

 - ⇒ better representation of connectivity constraints w.r.t. a 3-index compact model
- ▶ on the other hand: they are **in exponential number**
 - ⇒ the solving calls for a **Column Generation** approach

Facility Graph

- ▶ connectivity constraints defined on **subset of facilities** (rather than nodes)
- ▶ connectivity constraints can be **statically** generated

A Branch & Price algorithm for the VRPIRF

Pricing Problem

Pricing Problem

- ▶ the **Pricing Problem** delivers routes (and not rotations)
- ▶ it can be seen as an **Elementary Shortest Path Problem with Resource Constraint (ESPPRC)**
- ▶ solved with a **Dynamic Programming (DP)** algorithm inspired by that of [20]
- ▶ the expression of the reduced costs

$$\begin{aligned} \bar{c}_r^k = & \sum_{ij \in A} b_r^{ij} \cdot (d_{ij} - \tau_{ij} \cdot \beta_k^*) - \sum_{i \in C} a_r^i \cdot (\alpha_i^* + \tau_i \cdot \beta_k^* + \sum_{p \in F} e_r^{ip} \cdot \varphi_{kpi}^*) \\ & - e_r^{\Delta} \cdot \mu_k^{i*} - e_r^{\prime\prime\Delta} \cdot \mu_k^{\prime\prime*} - \sum_{p \in F} \frac{1}{2} (e_r^p + e_r^{\prime\prime p}) \cdot \tau_p \cdot \beta_k^* - \sum_{p \in F} (e_r^p - e_r^{\prime\prime p}) \cdot \theta_{kp}^* \\ & - \sum_{s \subseteq F} \sum_{p \in s} \left((e_r^{\Delta} + \sum_{q \notin s} e_r^q) \left(\sum_{q \in s} e_r^{\prime\prime q} \right) \cdot \delta_{kps}^{\prime*} + \left(\sum_{q \in s} e_r^q \right) (e_r^{\prime\prime\Delta} + \sum_{q \notin s} e_r^{\prime\prime q}) \cdot \delta_{kps}^{\prime\prime*} \right) \end{aligned}$$

calls for the solving of a pricing problem **per vehicle and per starting point**

Dominance Level

The dominance rule of [20] compares **cost, resources, unreachable nodes**. **Different dominance levels** are used to accelerate **ESPPRC convergence**

A Branch & Price algorithm for the VRPIRF

Pricing Problem

Dominance Level

The dominance rule of [20] compares **cost**, **resources**, **unreachable nodes**.
Different dominance levels are used to accelerate **ESPPRC convergence**

q -paths

A **completion bound** based on **q -paths** and **through- q -routes** is used (see [21]).
A new label is discarded if the sum of its cost and such bound is **nonnegative**.

[21] N.Christofides, A.Mingozzi, P.Toth, *Exact algorithms for the vehicle routing problem, based on spanning tree and shortest path relaxations*. *Mathematical Programming*, 20(1):255–282, 1981.

A Branch & Price algorithm for the VRPIRF

Pricing Problem

q -paths

A **completion bound** based on q -paths and **through- q -routes** is used (see [21]). A new label is discarded if the sum of its cost and such bound is **nonnegative**.

[21] N.Christofides, A.Mingozzi, P.Toth, *Exact algorithms for the vehicle routing problem, based on spanning tree and shortest path relaxations*. *Mathematical Programming*, 20(1):255–282, 1981.

ng -paths

ng -paths allow to **forbid n -loops**, $n \geq 2$ (see [22]).

They are used to further **restrain combinatorial explosion**:

- ▶ an **initial neighborhood** for each customer
- ▶ we replace the **unreachable nodes** with the **forbidden nodes** of an ng -path
 \Rightarrow the number of potential label on a node **decreases dramatically**
- ▶ if a nonelementary path occurs \Rightarrow enlarge the neighborhood and repeat.
 Experimentally this rarely happens \Rightarrow the use of ng -paths **pays off**

[22] R.Baldacci, A.Mingozzi, R.Roberti, *New Route Relaxation and Pricing Strategies for the Vehicle Routing Problem*. *Operations Research*, 59(5):1269–1283, 2011.

A Branch & Price algorithm for the VRPIRF

Branching

Branching rules

Three **Problem-tailored Branching rules** are defined and applied in this order:

1. branching on the **number of vehicles**: either we use no more than $\lfloor \sum_{k \in K} \tilde{x}^k \rfloor$ vehicles, or at least $\lceil \sum_{k \in K} \tilde{x}^k \rceil$
2. branching on the **activity variables** $y_p^k \Rightarrow$ the Pricing Problems related to vehicle k and facility p are affected
3. branching on **arc variables**:

$$x_{ij}^* = \sum_{r \in \mathcal{R}} b_r^{ij} \cdot x_r^*$$

We seek for the node with the **highest number of fractional outgoing arc variables** and impose one half of them to be 0 in each child node

Figure 9: Comparison of the Branch & Cut and the Branch & Price algorithms. Both are asked to perform a cutting plane at the root node on a sample of small instances, under a 1200s time limit.

A Branch & Price algorithm for the VRPIRF

A weakness of the model

The **connectivity constraints** have a **weaker impact** than the **connectivity valid inequalities** of the Branch & Cut algorithm

Figure 10: Detection of a fractional solution of a small instance that would be cut in the Branch & Cut algorithm but not in the Branch & Price algorithm.
